

The background of the slide is a light gray gradient. It is decorated with several realistic water droplets of various sizes. Some droplets are large and prominent, while others are small and scattered. They are rendered with soft shadows and highlights, giving them a three-dimensional appearance.

# **PROJECT: BUILD A DATA MART IN SQL**

AIRBNB

DEVELOPMENT PHASE

01

# Introduction

Abstract, workspace & Schema Creation

## **Abstract**

To implement the Airbnb database, I had to design and create a database that can effectively handle the Airbnb use case. This started with developing an ER Diagram (Entity Relationship Diagram) to visualize the entities, attributes and relationships involved.

Based on the ER Diagram, SQL statements were used to create the tables which were carefully designed to store information such as properties, bookings, users and other related data. To ensure functionality, test cases were developed which covered various scenarios property booking and user registration and also data retrieval. To execute these test cases I was able to ensure that the creation process and reproduction is possible.

Screenshots of the DBMS were captured to provide a visual representation of the implementations, and the screenshots showed actual data that is stored in the entities and the relationships between these entities. These are documented as part of the implementation process to ensure clarity and facilitate understanding of the implemented database structure. Throughout the implemented process feedback and hints were research from online tutorials and discussion forums to ensure accuracy and avoid making errors. These sources helped me understand the depth of database implementation and creation.

In conclusion, the implementation of the Airbnb DBMS required proper designs, SQL statements and test case development. The current database will provide a solid foundation for managing and meeting the requirement outlined in this use case.

## Workstation

For the Airbnb use case I used MySQL workbench as my Database Management System and to design my ER-Diagram. The DBMS used is a Community version which is an open source and freely downloadable. It is largely supported by a big community of developers, and it comes under a GPL License.

To set up the work environment one is required to install MySQL server before the workbench application.

## Workstation

For data appropriation I used a software called dbForge Studio for MySQL to create dummy data that is used within the database for the Airbnb use case.

**dbForge Studio for MySQL**

## Schema Creation

We use a schema called “airbnb” which is a logical representation of a database that describes the structural definition or description of entire database.

02

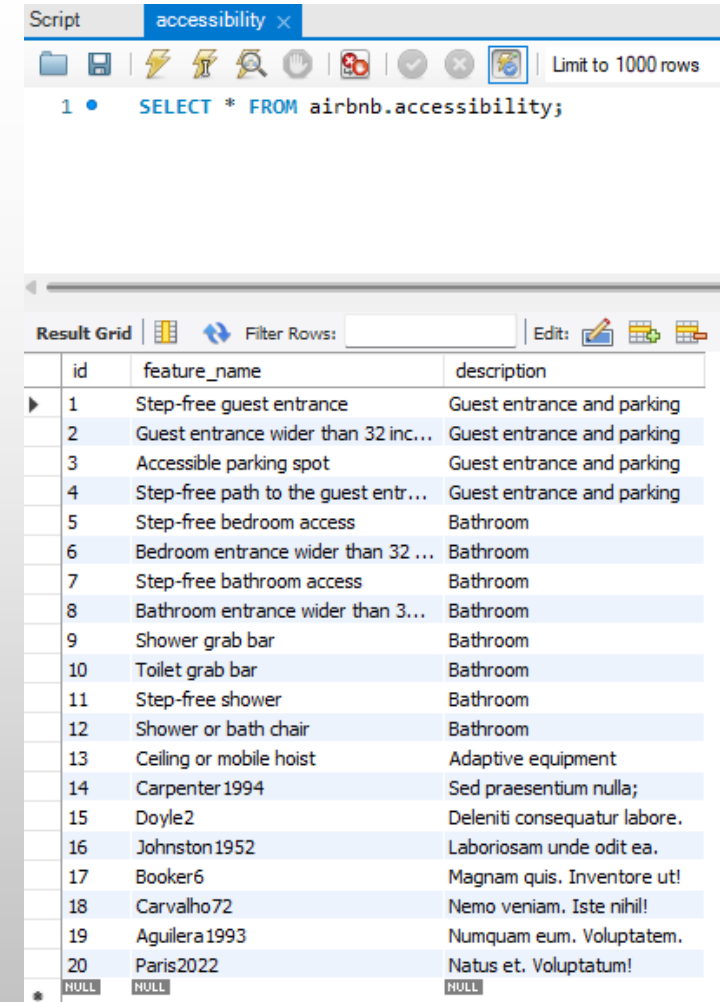

# Table Creation

Creation of tables together with their SQL Codes

- ACCESSIBILITY

```
CREATE TABLE `accessibility` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `feature_name` varchar(100) NOT NULL,  
  `description` varchar(100) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database interface with a script editor and a result grid. The script editor contains the SQL query: `SELECT * FROM airbnb.accessibility;`. The result grid displays the data returned by this query, showing 20 rows of accessibility features. The first four rows are related to guest entrance and parking, the next six rows are related to bathroom access, and the last ten rows are related to adaptive equipment and various accessibility features. The interface includes a toolbar with icons for file operations, a 'Limit to 1000 rows' option, and a 'Filter Rows' input field.

id	feature_name	description
1	Step-free guest entrance	Guest entrance and parking
2	Guest entrance wider than 32 inc...	Guest entrance and parking
3	Accessible parking spot	Guest entrance and parking
4	Step-free path to the guest entr...	Guest entrance and parking
5	Step-free bedroom access	Bathroom
6	Bedroom entrance wider than 32 ...	Bathroom
7	Step-free bathroom access	Bathroom
8	Bathroom entrance wider than 3...	Bathroom
9	Shower grab bar	Bathroom
10	Toilet grab bar	Bathroom
11	Step-free shower	Bathroom
12	Shower or bath chair	Bathroom
13	Ceiling or mobile hoist	Adaptive equipment
14	Carpenter1994	Sed praesentium nulla;
15	Doyle2	Deleniti consequat labore.
16	Johnston1952	Laboriosam unde odit ea.
17	Booker6	Magnam quis. Inventore ut!
18	Carvalho72	Nemo veniam. Iste nihil!
19	Aguilera1993	Numquam eum. Voluptatem.
20	Paris2022	Natus et. Voluptatum!
	NULL	NULL

SELECT & FROM function is used to select specific rows and columns from the table that are of interest.

## • ADDRESS

```
CREATE TABLE `address` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `region_id` int NOT NULL,  
  `country_id` int NOT NULL,  
  `state_id` int NOT NULL,  
  `city_id` int NOT NULL,  
  `zip` int NOT NULL,  
  `street_name` varchar(45) NOT NULL,  
  `latitude` float NOT NULL,  
  `longitude` float NOT NULL,  
  `created_at` date NOT NULL,  
  `updated_at` date NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `region_id_idx` (`region_id`),  
  KEY `country_id_idx` (`country_id`),  
  KEY `state_id_idx` (`state_id`),  
  KEY `city_id_idx` (`city_id`),  
  CONSTRAINT `city_id` FOREIGN KEY (`city_id`) REFERENCES `city` (`id`),  
  CONSTRAINT `country_id` FOREIGN KEY (`country_id`) REFERENCES `country` (`id`),  
  CONSTRAINT `region_id` FOREIGN KEY (`region_id`) REFERENCES `region` (`id`),  
  CONSTRAINT `state_id` FOREIGN KEY (`state_id`) REFERENCES `state` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window with a tab labeled 'address'. The SQL editor contains the query: `SELECT city_id, street_name FROM airbnb.address;`. Below the editor, the 'Result Grid' displays the query results. The grid has two columns: 'city\_id' and 'street\_name'. It lists 18 rows of data, with alternating light blue and white background colors for each row. The interface also includes a toolbar with icons for file operations, a 'Limit to 1000 rows' indicator, and options for 'Filter Rows', 'Export', and 'Wrap Cell'.

city_id	street_name
17	1630 Hidden Meadowview Lane
18	754 New Social Pkwy
7	336 Highland Lane
5	66 North Beachwood Street
11	1795 Riddle Hill Pkwy
18	3429 Farmview Lane
1	3040 South Sharp Hill Lane
3	390 Hidden Hazelwood Parkway
2	3225 East Riverview Ave
1	19 White Rock Hill Street
14	30 South Farmview Rd
17	895 West Rock Hill Parkway
8	3269 West Beachwood Road
1	807 Riddle Hill Blvd
2	82 South Parkwood Ct
13	1816 N Highland Lane
5	3324 New Church Avenue
4	3630 Woodrow Ct
3	19 Town Blvd
3	602 Brentwood Hwy

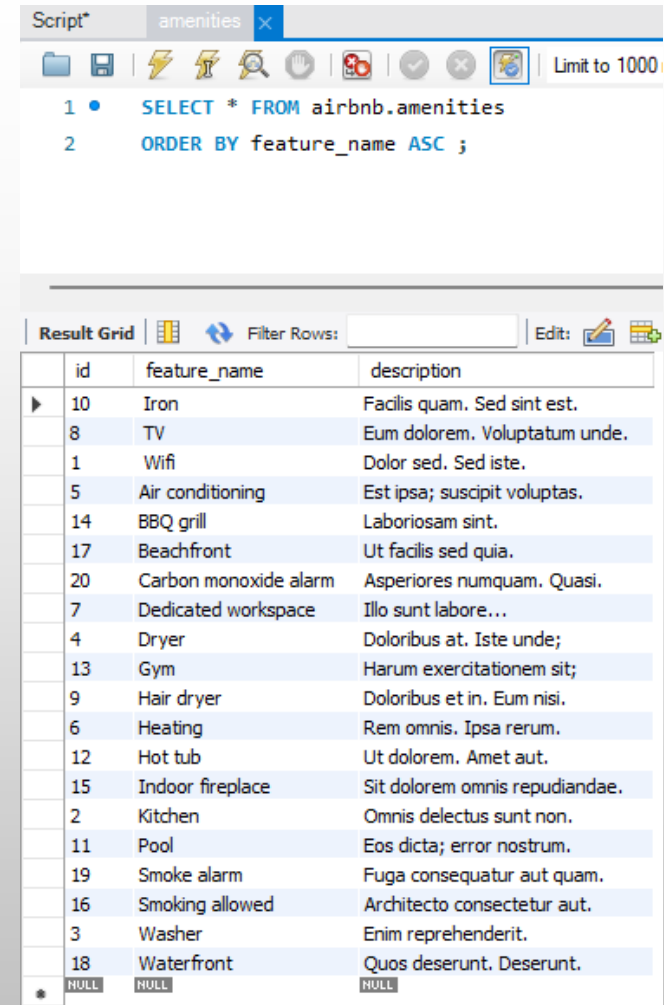

From the SELECT function columns that are to be selected are separated by “,” in case it is more than one column.

- AMENITIES

```
CREATE TABLE `amenities` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `feature_name` varchar(45) NOT NULL,  
  `description` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window titled 'Script\*' with a tab for 'amenities'. The SQL query is: `SELECT * FROM airbnb.amenities ORDER BY feature_name ASC ;`. Below the query, the 'Result Grid' shows 19 rows of data. The columns are 'id', 'feature\_name', and 'description'. The rows are sorted by 'feature\_name' in ascending order. The last row shows 'NULL' for all three columns.

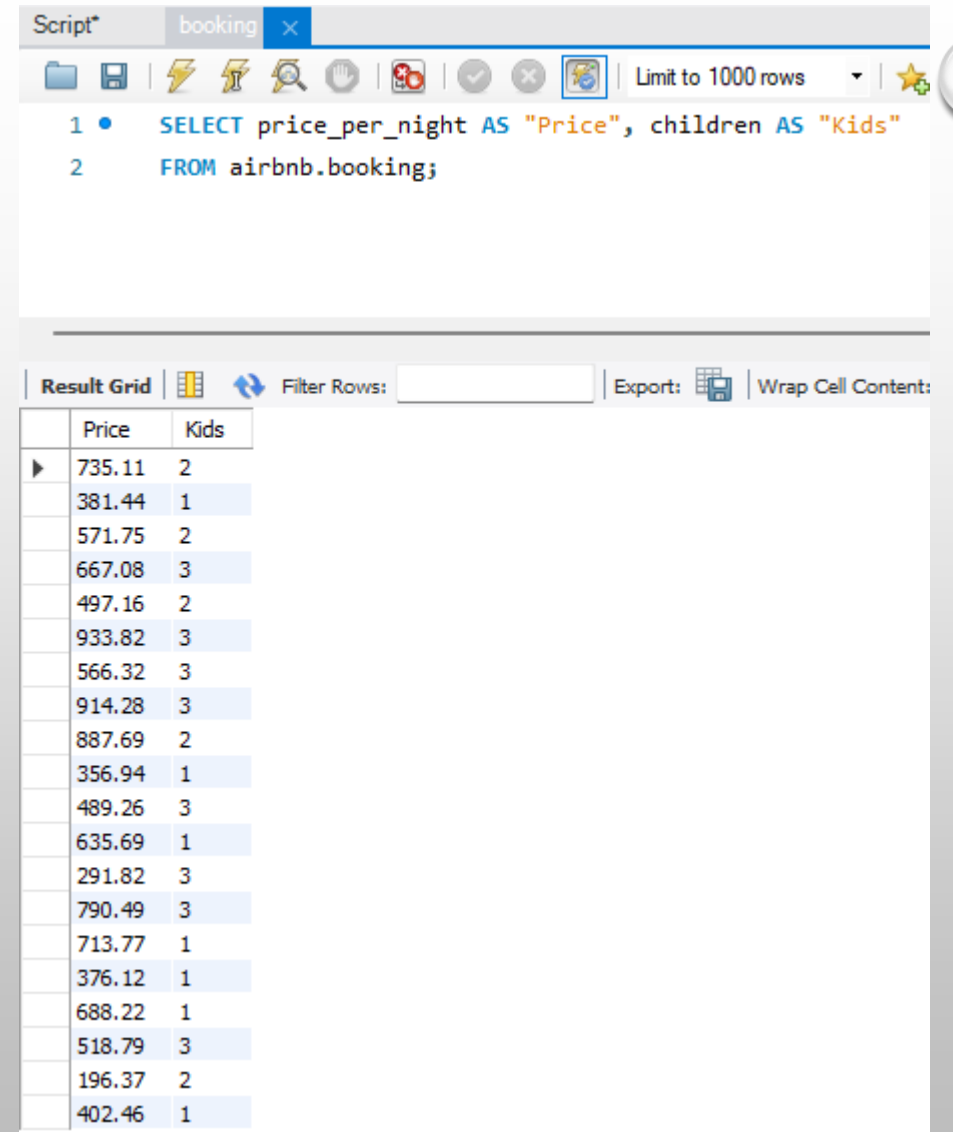

id	feature_name	description
10	Iron	Facilis quam. Sed sint est.
8	TV	Eum dolorem. Voluptatum unde.
1	Wifi	Dolor sed. Sed iste.
5	Air conditioning	Est ipsa; suscipit voluptas.
14	BBQ grill	Laboriosam sint.
17	Beachfront	Ut facilis sed quia.
20	Carbon monoxide alarm	Asperiores numquam. Quasi.
7	Dedicated workspace	Illo sunt labore...
4	Dryer	Doloribus at. Iste unde;
13	Gym	Harum exercitationem sit;
9	Hair dryer	Doloribus et in. Eum nisi.
6	Heating	Rem omnis. Ipsa rerum.
12	Hot tub	Ut dolorem. Amet aut.
15	Indoor fireplace	Sit dolorem omnis repudiandae.
2	Kitchen	Omnis delectus sunt non.
11	Pool	Eos dicta; error nostrum.
19	Smoke alarm	Fuga consequatur aut quam.
16	Smoking allowed	Architecto consectetur aut.
3	Washer	Enim reprehenderit.
18	Waterfront	Quos deserunt. Deserunt.
NULL	NULL	NULL

We can use function ORDER BY to query results of a column to arrange them with Ascending order.

- **BOOKING**

```
CREATE TABLE `booking` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `guest_id` int NOT NULL,  
  `property_id` int NOT NULL,  
  `checkin_date` date NOT NULL,  
  `checkout_date` date NOT NULL,  
  `price_per_night` decimal(10,2) NOT NULL,  
  `children` int NOT NULL,  
  `adults` int NOT NULL,  
  `created_at` date NOT NULL,  
  `updated_at` date NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `guest_id_idx` (`guest_id`),  
  KEY `property_id_idx` (`property_id`),  
  CONSTRAINT `guest_id` FOREIGN KEY (`guest_id`) REFERENCES `user` (`id`),  
  CONSTRAINT `property_id` FOREIGN KEY (`property_id`) REFERENCES `property` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window titled 'Script' with a tab for 'booking'. The SQL query is: `SELECT price_per_night AS "Price", children AS "Kids" FROM airbnb.booking;`. The results are displayed in a 'Result Grid' with columns 'Price' and 'Kids'. The grid shows 20 rows of data, with the first row highlighted. The interface includes a toolbar with icons for file operations, a 'Limit to 1000 rows' dropdown, and an 'Export' button.

	Price	Kids
1	735.11	2
2	381.44	1
	571.75	2
	667.08	3
	497.16	2
	933.82	3
	566.32	3
	914.28	3
	887.69	2
	356.94	1
	489.26	3
	635.69	1
	291.82	3
	790.49	3
	713.77	1
	376.12	1
	688.22	1
	518.79	3
	196.37	2
	402.46	1

We can use the AS functions to display our columns as the names we prefer.

- CITY

```
CREATE TABLE `city` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `state_id` int NOT NULL,  
  `name` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `state_id_city_idx` (`state_id`),  
  CONSTRAINT `state_id_city` FOREIGN KEY (`state_id`) REFERENCES `state` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window with a tab titled 'city'. The script editor contains two lines of SQL: `SELECT * FROM airbnb.city` and `ORDER BY name LIMIT 12 ;`. Below the script, the 'Result Grid' tab is active, displaying a table with 12 rows and 3 columns: 'id', 'state\_id', and 'name'. The rows are sorted by name in ascending order. The first row is highlighted with a mouse cursor.

	id	state_id	name
▶	1	18	Abbeville
	7	20	Abbotsford
	12	6	Abercrombie
	14	15	Aberdeen
	5	17	Brockport
	8	10	Brockton
	13	6	Brockway
	18	8	Brockwell
	6	16	Emigsville
	15	7	Emily
	10	12	Harlowton
	20	14	Harmon
*	NULL	NULL	NULL

We can set the limit of rows to be displayed after sorting them by ascending order.

- COUNTRY

```
CREATE TABLE `country` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `region_id` int NOT NULL,  
  `name` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `region_id_idx` (`region_id`),  
  CONSTRAINT `region_id_cou` FOREIGN KEY (`region_id`) REFERENCES `region` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database script editor window titled 'Script\*' with a tab for 'country'. The script contains two lines of SQL: `1 SELECT * FROM airbnb.country` and `2 ORDER BY region_id ASC;`. Below the script, a 'Result Grid' displays the query results. The grid has three columns: 'id', 'region\_id', and 'name'. It lists 20 countries, grouped by region\_id. Region 1 includes France, Philippines, Portugal, Finland, Romania, and Gambia. Region 2 includes Denmark and Jordan. Region 3 includes Nigeria, Zambia, and Malawi. Region 4 includes Cuba. Region 5 includes Suriname and United Kingdom. Region 6 includes Philippines, Hungary, and Japan. Region 8 includes Austria and Iceland. Region 9 includes Albania. The bottom row of the grid shows 'NULL' for all three columns.

	id	region_id	name
▶	1	1	France
	7	1	Philippines
	9	1	Portugal
	12	1	Finland
	14	1	Romania
	18	1	Gambia
	17	2	Denmark
	19	2	Jordan
	10	3	Nigeria
	11	3	Zambia
	15	3	Malawi
	6	4	Cuba
	2	5	Suriname
	13	5	United Ki...
	3	6	Philippines
	8	6	Hungary
	20	6	Japan
	5	8	Austria
	16	8	Iceland
	4	9	Albania
*	NULL	NULL	NULL

Names of countries that are available on the address entity.

- HOST

```
CREATE TABLE `host` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `banking_details` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window with a tab labeled 'host'. The script editor contains the SQL query: `SELECT * FROM airbnb.host;`. Below the script editor, the 'Result Grid' is displayed, showing the results of the query. The grid has two columns: 'id' and 'banking\_details'. There are two rows of data, and a third row for NULL values.

	id	banking_details
▶	1	NL 84JD HH83 0098 0630
	2	IT 35W6 4343 1899 5BL8 32IA 18GG 9
*	NULL	NULL

The results of the hosts of the properties.

- HOST LANGUAGE

```
CREATE TABLE `host_language` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `host_id` int NOT NULL,  
  `language_id` int NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `host_id_idx` (`host_id`),  
  KEY `language_id_idx` (`language_id`),  
  CONSTRAINT `host_id` FOREIGN KEY (`host_id`) REFERENCES `host` (`id`),  
  CONSTRAINT `language_id` FOREIGN KEY (`language_id`) REFERENCES `language` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database management tool interface. At the top, there's a tab labeled 'Script\*' and a sub-tab 'host\_language'. Below the tabs is a toolbar with various icons and a 'Limit to 1000 rows' option. The main area displays a SQL query with five lines. Below the query, there's a 'Result Grid' section with a table showing the results of the query. The table has two columns: 'Host ID' and 'language\_name'. The results show a list of hosts and the languages they speak, ordered by host\_id.

```
1 SELECT host_id AS 'Host ID', P.language_name  
2 FROM airbnb.host_language AS hl  
3 JOIN airbnb.language AS P  
4 ON language_id = P.id  
5 WHERE host_id <= 20 ORDER BY host_id ASC;
```

	Host ID	language_name
▶	1	Tsonga
	1	Aragonese
	1	Tsonga
	1	Xhosa
	1	Tsonga
	1	Xhosa
	1	Xhosa
	1	Assamese
	1	Twi
	1	Kazakh
	1	Urdu
	2	Armenian
	2	Zulu
	2	Twi
	2	Urdu
	2	Kongo
	2	Armenian
	2	Tsonga
	2	Tsonga
	2	Kazakh

The table for the language is used to join with the host language so that we can display which host speaks which languages.

## • IMAGE

```
CREATE TABLE `image` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `property_id` int NOT NULL,  
  `user` int NOT NULL,  
  `image_name` varchar(45) NOT NULL,  
  `file_location` varchar(45) NOT NULL,  
  `create_at` date NOT NULL,  
  `updated_at` date NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `property_id_ima_idx` (`property_id`),  
  KEY `user_id_ima_idx` (`user`),  
  CONSTRAINT `property_id_ima` FOREIGN KEY (`property_id`) REFERENCES `property` (`id`),  
  CONSTRAINT `user_id_ima` FOREIGN KEY (`user`) REFERENCES `user` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database script editor with a tab labeled 'image'. The script contains a SQL query that joins the 'airbnb.image' table with the 'airbnb.user' table. The query selects the property ID, concatenates the user's first and last names, and the image name. The results are displayed in a table with columns: Property, Uploaded by, and Image Title. The table contains 20 rows of data.

```
Script* image x  
Limit to 1000 rows  
1 • SELECT i.property_id AS Property, concat(u.first_name, ' ', u.last_name)  
2 AS 'Uploaded by' , i.image_name AS 'Image Title'  
3 FROM airbnb.image AS i JOIN airbnb.user AS u ON i.user = u.id  
4 ORDER BY property_id;
```

	Property	Uploaded by	Image Title
1	1	Lasonya Galvan	nfwjeebugm
	1	Marion Vanhooose	dkhinkigdi
	1	Chelsie Madsen	ftwuembyuf
	2	Delphine Puckett	uhmyquhjkw
	3	Garrett Mohr	ovwaibbixz
	7	Chelsie Madsen	cafrsotdz
	7	Garrett Mohr	verjdswwcp
	8	Rubie Sherrill	aalyvcyqbf
	8	Cheree Boles	adjblvnart
	9	Elene Sheridan	jcwpmuktqd
	11	Marion Vanhooose	txxmfrnukk
	12	Addie Bolin	jdzgwevdoe
	12	Gerard Sherman	xsvrzglobu
	12	Deidre Dell	kzosapxseq
	13	Bobbie Janssen	tqiwpkausp
	15	Bobbie Janssen	qjqeeivajp
	17	Humberto Colon	lgebtjfwap
	17	Adrienne Pryor	chhihpqgee
	19	Addie Bolin	eolxcxoanp
	20	Addie Bolin	fbfduyxsxb

We can use the JOIN function to join a related table (user) to extract the names and use the Concatenate function to merge the first and last name.

- LANGUAGE

```
CREATE TABLE `language` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `language_name` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database management tool interface. At the top, there's a tab labeled 'language'. Below it, a SQL script is displayed with two lines: 'SELECT \* FROM airbnb.language' and 'ORDER BY language\_name ASC;'. Below the script, there's a 'Result Grid' section. It contains a table with two columns: 'id' and 'language\_name'. The table lists 19 languages in ascending order of their IDs. The last row shows 'NULL' for both columns.

id	language_name
8	Aragonese
9	Armenian
18	Assamese
15	Bulgarian
11	Esperanto
2	Indonesian
13	Kazakh
7	Kongo
10	Oromo
19	Sardinian
1	Serbian
4	Tsonga
12	Tsonga
17	Tswana
3	Twi
5	Twi
20	Urdu
6	Xhosa
14	Zulu
16	Zulu
NULL	NULL

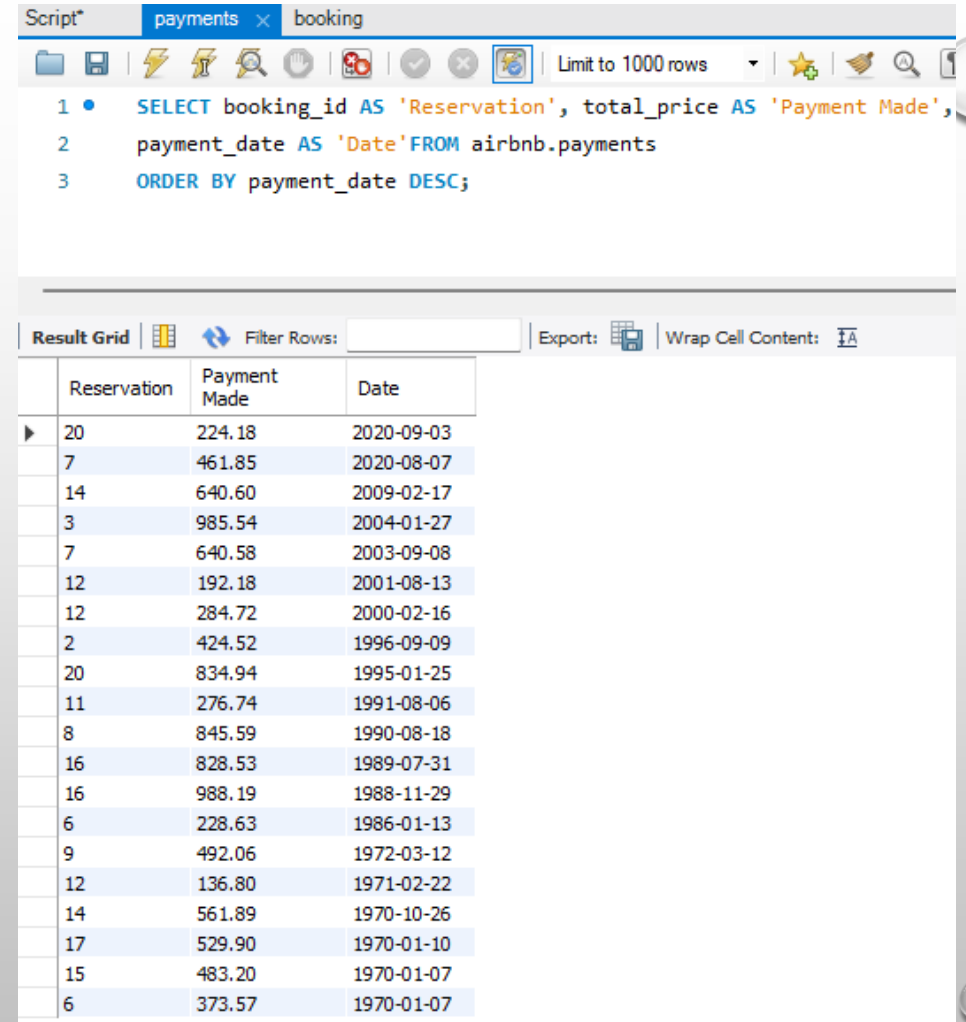

We can display the languages that are spoken by the Hosts then arrange them in ascending order for easy readability.

## • PAYMENT

```
CREATE TABLE `payments` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `booking_id` int NOT NULL,  
  `total_price` decimal(10,2) NOT NULL,  
  `payment_date` date NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `booking_id_pay_idx` (`booking_id`),  
  CONSTRAINT `booking_id_pay` FOREIGN KEY (`booking_id`) REFERENCES `booking` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window with two tabs: 'payments' and 'booking'. The 'payments' tab is active, displaying a SQL script. Below the script, the 'Result Grid' shows the output of the query, sorted by payment date in descending order. The grid has four columns: 'Reservation', 'Payment Made', and 'Date'. The first row is highlighted with a mouse cursor.

	Reservation	Payment Made	Date
▶	20	224.18	2020-09-03
	7	461.85	2020-08-07
	14	640.60	2009-02-17
	3	985.54	2004-01-27
	7	640.58	2003-09-08
	12	192.18	2001-08-13
	12	284.72	2000-02-16
	2	424.52	1996-09-09
	20	834.94	1995-01-25
	11	276.74	1991-08-06
	8	845.59	1990-08-18
	16	828.53	1989-07-31
	16	988.19	1988-11-29
	6	228.63	1986-01-13
	9	492.06	1972-03-12
	12	136.80	1971-02-22
	14	561.89	1970-10-26
	17	529.90	1970-01-10
	15	483.20	1970-01-07
	6	373.57	1970-01-07

For easy record accessing via date of payment we can use the ORDER BY function to sort the results by date starting with the latest payment date.

## • PROPERTY

```
CREATE TABLE `property` (
  `id` int NOT NULL AUTO_INCREMENT,
  `host_id` int NOT NULL,
  `property_type_id` int NOT NULL,
  `room_type_id` int NOT NULL,
  `address_id` int NOT NULL,
  `bed_type` varchar(45) NOT NULL,
  `occupants` int NOT NULL,
  `bathrooms` int NOT NULL,
  `bedrooms` int NOT NULL,
  `price` decimal(10,2) NOT NULL,
  `description` varchar(45) NOT NULL,
  `latitude` float NOT NULL,
  `longitude` float NOT NULL,
  PRIMARY KEY (`id`),
  KEY `host_id_prop_idx` (`host_id`),
  KEY `property_type_id_prop_idx` (`property_type_id`),
  KEY `room_type_id_idx` (`room_type_id`),
  KEY `address_id_prop_idx` (`address_id`),
  CONSTRAINT `address_id_prop` FOREIGN KEY (`address_id`) REFERENCES `address` (`id`),
  CONSTRAINT `host_id_prop` FOREIGN KEY (`host_id`) REFERENCES `host` (`id`),
  CONSTRAINT `property_type_id_prop` FOREIGN KEY (`property_type_id`) REFERENCES `property_type` (`id`),
  CONSTRAINT `room_type_id` FOREIGN KEY (`room_type_id`) REFERENCES `room_type` (`id`)
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

Script\* property x

Limit to 1000 rows

```
1 • SELECT p.id AS 'Property ID', host_id AS 'Host ID',
2   property_type_id AS 'Property type', room_type_id AS 'Room type'
3   FROM airbnb.property AS p
4   JOIN airbnb.property_type AS pt ON p.property_type_id = pt.id
5   JOIN airbnb.room_type AS plt ON p.room_type_id = plt.id
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: |

	Property ID	Host ID	Property type	Room type
▶	1	2	1	1
	5	1	1	4
	8	2	1	4
	10	2	1	3
	20	2	1	3
	3	1	2	4
	4	1	2	1
	6	2	2	4
	9	1	2	3
	15	1	2	4
	7	2	3	2
	11	2	3	4
	12	2	3	1
	14	2	3	3
	19	2	3	3
	2	1	4	3
	13	1	4	1
	16	2	4	4
	17	2	4	4
	18	2	4	2

Property is filter to show results of the host and what conditions or what kind of properties do they have.

- PAYMENT ACCESSIBILITY

```
CREATE TABLE `property_accessibility` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `accessibility_id` int NOT NULL,  
  `property_id` int NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `accessibility_id_idx` (`accessibility_id`),  
  KEY `property_id_acc_idx` (`property_id`),  
  CONSTRAINT `accessibility_id` FOREIGN KEY (`accessibility_id`) REFERENCES `accessibility` (`id`),  
  CONSTRAINT `property_id_acc` FOREIGN KEY (`property_id`) REFERENCES `property` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database management interface. At the top, there's a tab labeled 'property\_accessibility'. Below it, a SQL script is entered: `SELECT * FROM airbnb.property_accessibility;`. The results are displayed in a 'Result Grid' below the script. The grid has three columns: 'id', 'accessibility\_id', and 'property\_id'. It contains 20 rows of data, each with a unique 'id' and corresponding 'accessibility\_id' and 'property\_id' values. At the bottom of the grid, there's a row with 'NULL' values for all three columns.

	id	accessibility_id	property_id
1	16	19	
2	1	5	
3	10	20	
4	4	3	
5	12	19	
6	3	5	
7	16	19	
8	18	1	
9	17	18	
10	20	2	
11	11	4	
12	7	18	
13	20	1	
14	8	8	
15	15	12	
16	20	4	
17	12	8	
18	18	20	
19	12	13	
20	12	15	
*	NULL	NULL	NULL

The property and what accessibility it does have so that we can know also what guests are drawn to.

## • PROPERTY AMENITIES

```
CREATE TABLE `property_amenities` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `property_id` int NOT NULL,  
  `amenity_id` int NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `property_id_ame_idx` (`property_id`),  
  KEY `amenity_id_idx` (`amenity_id`),  
  CONSTRAINT `amenity_id` FOREIGN KEY (`amenity_id`) REFERENCES `amenities` (`id`),  
  CONSTRAINT `property_id_ame` FOREIGN KEY (`property_id`) REFERENCES `property` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database management interface. At the top, a tab labeled 'property\_amenities' is active. Below the tab, a toolbar contains icons for file operations and a 'Limit to 100' dropdown. A SQL script is entered in the text area: `1 • SELECT * FROM airbnb.property_amenities;`. Below the script, a 'Result Grid' section displays the query results in a table format. The table has three columns: 'id', 'property\_id', and 'amenity\_id'. It contains 20 rows of data, each with a unique 'id' and corresponding 'property\_id' and 'amenity\_id' values. At the bottom of the grid, there is a row with three 'NULL' values.

	id	property_id	amenity_id
▶	1	3	10
	2	12	3
	3	1	3
	4	2	1
	5	5	16
	6	7	1
	7	14	17
	8	13	20
	9	11	8
	10	17	7
	11	6	7
	12	17	4
	13	18	3
	14	20	1
	15	2	15
	16	16	16
	17	7	7
	18	18	4
	19	1	6
	20	14	16
*	NULL	NULL	NULL

Each property is associated with an amenity that is displayed as results.

- **PROPERTY TYPE**

```
CREATE TABLE `property_type` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `type_name` varchar(100) NOT NULL,  
  `description` varchar(100) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database script editor window titled 'property\_type'. The script contains a single query: `SELECT * FROM airbnb.property_type;`. Below the script, the 'Result Grid' displays the query results. The grid has three columns: 'id', 'type\_name', and 'description'. It contains four rows of data: (1, 'apartment', 'rented residential units that are part of a building.'), (2, 'duplex', 'a single structure with two private living spaces ...'), (3, 'single-family home', 'stand alone unit fit for a family.'), and (4, 'villa', 'unit with its own garage with internal access.'). A fifth row shows 'NULL' values for all three columns. The interface includes standard database tool icons and a 'Limit to 1000 rows' dropdown.

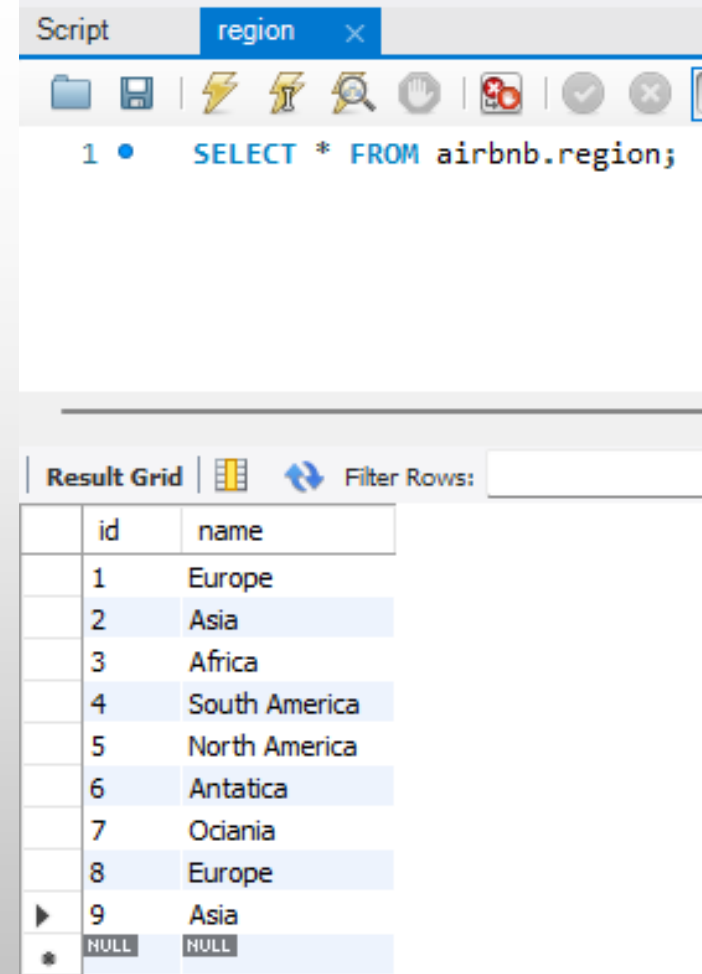

id	type_name	description
1	apartment	rented residential units that are part of a building.
2	duplex	a single structure with two private living spaces ...
3	single-family home	stand alone unit fit for a family.
4	villa	unit with its own garage with internal access.
NULL	NULL	NULL

Results show the type of property offered by the host.

- REGION

```
CREATE TABLE `region` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `name` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client interface. At the top, there's a tab labeled 'region'. Below it, a toolbar contains icons for file operations and execution. The main area displays a SQL query: `SELECT * FROM airbnb.region;`. Below the query, a 'Result Grid' tab is active, showing a table with two columns: 'id' and 'name'. The table contains 9 rows of data, with the last row showing 'NULL' for both columns. A 'Filter Rows' input field is located to the right of the table.

	id	name
1	1	Europe
2	2	Asia
3	3	Africa
4	4	South America
5	5	North America
6	6	Antatica
7	7	Ociania
8	8	Europe
9	9	Asia
*	NULL	NULL

A selection for the different regions that properties can be booked by guests.

- REVIEW

```
CREATE TABLE `review` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `booking_id` int NOT NULL,  
  `property_id` int NOT NULL,  
  `guest_id` int NOT NULL,  
  `rating` int NOT NULL,  
  `comment` varchar(45) NOT NULL,  
  `created_at` date NOT NULL,  
  PRIMARY KEY (`id`),  
  KEY `customer_id_idx` (`guest_id`),  
  KEY `property_id_idx` (`property_id`),  
  KEY `booking_id_rev_idx` (`booking_id`),  
  CONSTRAINT `booking_id_rev` FOREIGN KEY (`booking_id`) REFERENCES `booking` (`id`),  
  CONSTRAINT `guest_id_rev` FOREIGN KEY (`guest_id`) REFERENCES `user` (`id`),  
  CONSTRAINT `property_id_rev` FOREIGN KEY (`property_id`) REFERENCES `property` (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window titled 'Script\*' with a tab for 'review'. The SQL script in the editor is:

```
1 • SELECT booking_id, rating, comment  
2 FROM airbnb.review  
3 WHERE rating = 4;
```

Below the script, the 'Result Grid' shows the output of the query. It has columns for 'booking\_id', 'rating', and 'comment'. There are 6 rows of data, all with a rating of 4.

	booking_id	rating	comment
▶	13	4	Aperiam quis. Asperiores.
	11	4	Perspiciatis laboriosam et.
	14	4	Necessitatibus voluptate.
	10	4	In non. Assumenda aut!
	6	4	Molestias at. Et aliquid.
	15	4	Rerum sit iure porro.

Using the WHERE statement we can select only display only rows that have a rating of 4.

- ROOM TYPE

```
CREATE TABLE `room_type` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `type_name` varchar(100) NOT NULL,  
  `description` varchar(100) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database management interface. At the top, a tab labeled 'room\_type' is active. Below it, a SQL script is entered: `SELECT * FROM airbnb.room_type;`. The results are displayed in a 'Result Grid' below the script. The grid has four columns: 'id', 'type\_name', and 'description'. It contains four rows of data representing different room types. A fifth row shows 'NULL' values for all three columns. The interface includes various icons for file operations, a search icon, and a 'Limit to 1000 rows' dropdown.

	id	type_name	description
▶	1	single room	room with just a single bed for just one adult in ...
	2	standard room	room with double bed, tv and fit for a couple.
	3	executive room	room with all accessories and typically with a gr...
	4	presidential room	A place all to yourself.
*	NULL	NULL	NULL

This table is supposed to go alongside with the property entity so that when guest view their preferences they are provided with enough details on the property.

- STATE

```
CREATE TABLE `state` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `name` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database management tool interface. At the top, there's a 'Script\*' tab and a 'State' tab. Below the tabs, a SQL script is displayed: `1 SELECT * FROM airbnb.state` and `2 ORDER BY name ASC;`. Below the script, there's a 'Result Grid' section. It contains a table with two columns: 'id' and 'name'. The table lists 19 states in ascending order of their names: Alabama, Arizona, Arkansas, Arkansas, Delaware, Florida, Indiana, Louisiana, Michigan, Minnesota, Nevada, New Mexico, New York, North Ca..., North Ca..., Ohio, Oregon, Virginia, Wyoming, and Wyoming. The last two rows are marked with 'NULL' in the 'id' column.

	id	name
▶	1	Alabama
	13	Arizona
	7	Arkansas
	20	Arkansas
	6	Delaware
	14	Florida
	4	Indiana
	18	Louisiana
	5	Michigan
	11	Minnesota
	9	Nevada
	17	New Mexico
	2	New York
	3	North Ca...
	15	North Ca...
	10	Ohio
	12	Oregon
	16	Virginia
	8	Wyoming
	19	Wyoming
*	NULL	NULL

The Order by function is used to arrange the states by a specified order.

- USER

```
CREATE TABLE `user` (
  `id` int NOT NULL AUTO_INCREMENT,
  `user_type_id` int NOT NULL,
  `username` varchar(45) NOT NULL,
  `email` varchar(45) NOT NULL,
  `password` varchar(45) NOT NULL,
  `first_name` varchar(45) NOT NULL,
  `last_name` varchar(45) NOT NULL,
  `gender` varchar(45) NOT NULL,
  `date_of_birth` date NOT NULL,
  PRIMARY KEY (`id`),
  KEY `user_type_id_idx` (`user_type_id`),
  CONSTRAINT `user_type_id` FOREIGN KEY (`user_type_id`) REFERENCES `user_type` (`id`)
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

Script\* State user x

Limit to 1000 rows

```
1 • SELECT user_type_id AS 'User Type', username, email,
2 password AS 'Password', first_name AS 'Name',
3 last_name AS 'Surname', gender AS 'Gender',
4 date_of_birth AS 'Date of Birth' FROM airbnb.user;
```

Result Grid Filter Rows: Export: Wrap Cell Content:

	User Type	username	email	Password	Name	Surname	Gender	Date of Birth

Function AS helps display columns as preferred names for easy readability when using the database.

- **USER TYPE**

```
CREATE TABLE `user_type` (  
  `id` int NOT NULL AUTO_INCREMENT,  
  `type` varchar(45) NOT NULL,  
  PRIMARY KEY (`id`)  
) ENGINE=InnoDB AUTO_INCREMENT=21 DEFAULT CHARSET=utf8mb4 COLLATE=utf8mb4_0900_ai_ci
```

Create table

The screenshot shows a database client window with a tab labeled 'user\_type'. The SQL editor contains the query: `SELECT * FROM airbnb.user_type;`. Below the editor, the 'Result Grid' tab is active, displaying the query results in a table with two columns: 'id' and 'type'. The results show two rows: one with 'id' 1 and 'type' 'host', and another with 'id' 2 and 'type' 'guest'. A third row with 'id' NULL and 'type' NULL is also visible.

	id	type
▶	1	host
	2	guest
*	NULL	NULL

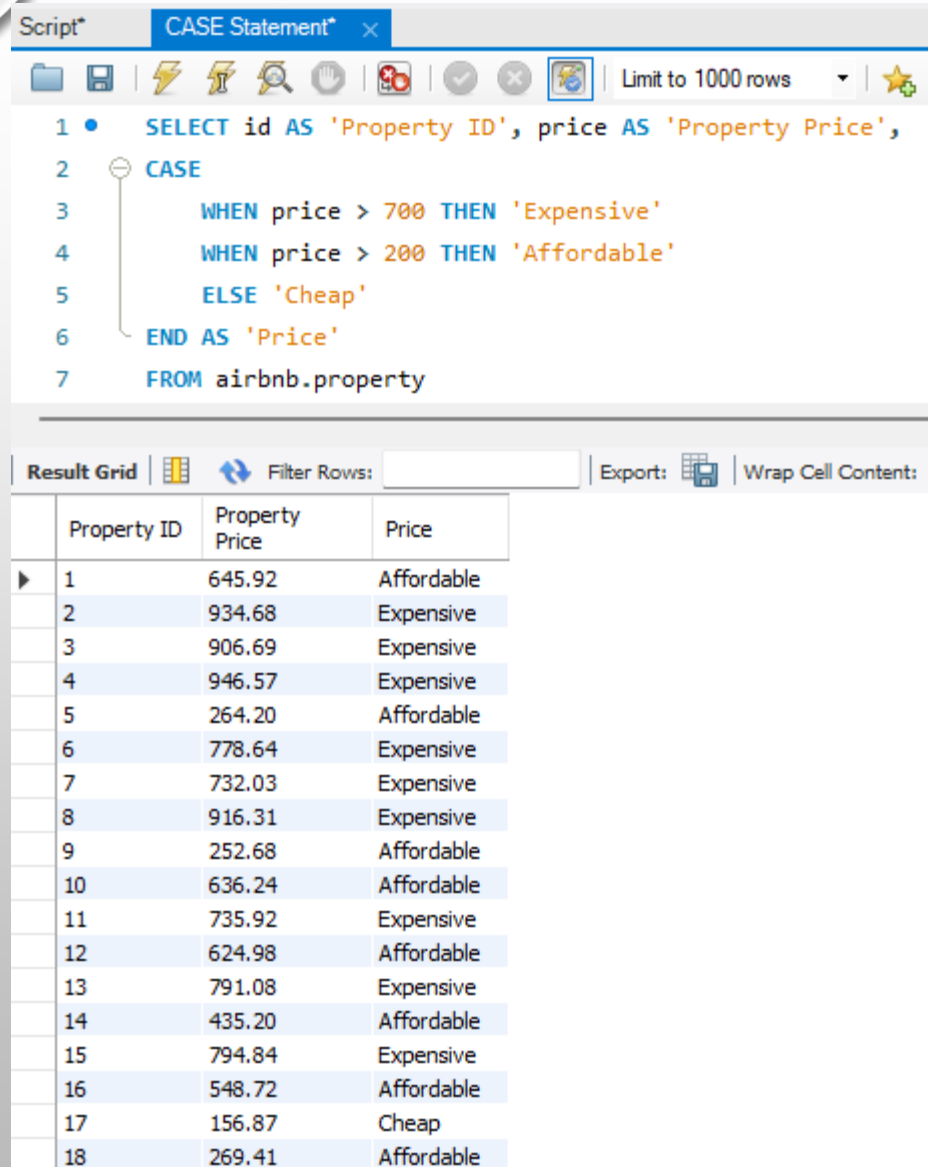

Results of this query displays the two types of users for the Airbnb resources.

**03**

# **TEST CASES**

- **CASE STATEMENT**

The screenshot shows a SQL IDE window titled 'CASE Statement\*'. The query editor contains the following SQL code:

```
1 • SELECT id AS 'Property ID', price AS 'Property Price',  
2 CASE  
3     WHEN price > 700 THEN 'Expensive'  
4     WHEN price > 200 THEN 'Affordable'  
5     ELSE 'Cheap'  
6 END AS 'Price'  
7 FROM airbnb.property
```

Below the query editor is the 'Result Grid' section, which displays the results of the query. The grid has four columns: 'Property ID', 'Property Price', and 'Price'. The 'Price' column contains the results of the CASE statement. The results are as follows:

Property ID	Property Price	Price
1	645.92	Affordable
2	934.68	Expensive
3	906.69	Expensive
4	946.57	Expensive
5	264.20	Affordable
6	778.64	Expensive
7	732.03	Expensive
8	916.31	Expensive
9	252.68	Affordable
10	636.24	Affordable
11	735.92	Expensive
12	624.98	Affordable
13	791.08	Expensive
14	435.20	Affordable
15	794.84	Expensive
16	548.72	Affordable
17	156.87	Cheap
18	269.41	Affordable

A CASE is a statement that operates if-then-else type of logical queries. In this test case, I used property table to describe the price column to show affordability of each property to each guest.

## • FUNCTIONS

Script\* image x

Limit to 1000 rows

```

1 • SELECT i.property_id AS Property, concat(u.first_name, ' ', u.last_name)
2   AS 'Uploaded by' , i.image_name AS 'Image Title'
3   FROM airbnb.image AS i JOIN airbnb.user AS u ON i.user = u.id
4   ORDER BY property_id;

```

### JOIN & CONCATENATE FUNCTION

Here the Concatenate Function has been used to take values from two columns and then put them together in one. JOIN is also used to reference the table that the Concatenate function is going to be used on to.

Script\* payments x

Limit to 1000 rows

```

1 • SELECT
2   AVG(total_price) AS 'Average Total Price'
3   FROM airbnb.payments;

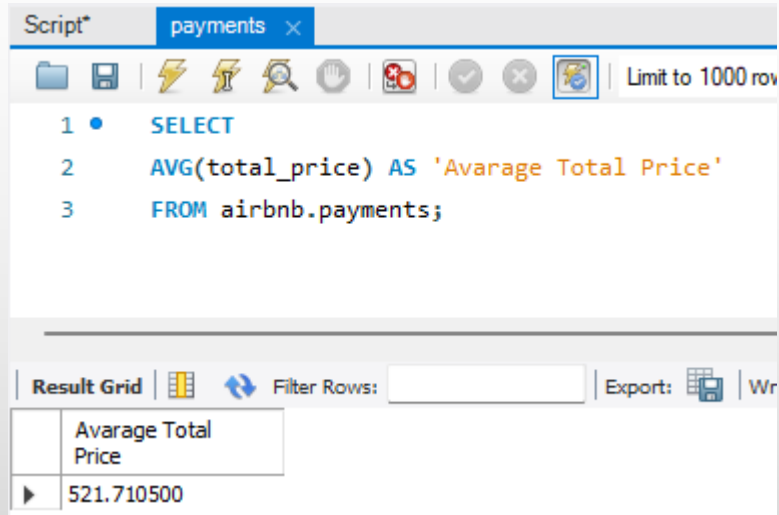

```

Result Grid | Filter Rows: | Export: | Wr

	Average Total Price
▶	521.710500

### AVERAGE FUNCTION

- **FUNCTIONS**

The screenshot shows a SQL script editor window titled "Script" with a tab for "payments". The script contains three lines of SQL code: 1. SELECT, 2. AVG(total\_price) AS 'Avarage Total Price', and 3. FROM airbnb.payments;. Below the script, there is a "Result Grid" section with a "Filter Rows" input field and an "Export" button. The result grid displays a single row with the column name "Avarage Total Price" and the value "521.710500".

```
1 • SELECT
2   AVG(total_price) AS 'Avarage Total Price'
3   FROM airbnb.payments;
```

Avarage Total Price
521.710500

Here the Concatenate Function has been used to take values from two columns and then put them together in one. JOIN is also used to reference the table that the Concatenate function is going to be used on to.

**THANK YOU**
